# Example of angle of rotation display

#### Explanation of measurements display Angle of rotation

The angle of rotation is the basic numeric value measured by polarimeters, and changes depending on the concentration of the solution, the length of the observation tube, temperature, and/or the measurement wavelength. It is symbolized by "a" and indicated in "°."

International Sugar Scale

The measurement value of 26g of sucrose in 100ml of sucrose solution in a 200mm observation tube is 100°Z. This measurement value is commonly used in the sugar manufacturing industry, and is usually temperature-compensated to the reference temperature of 20°C (68°F). The AP-300 can display the measurement value with or without temp compensation (Automatic Temperature Compensation, "ATC").

Specific Rotation

The Specific Rotation is a numeric value unique to each substance. By definition, the specific rotation value is equivalent to the angle of rotation obtained by a measuring a solution of 100% concentration in a 100mm observation tube (although such a measurement is actually not practical).

Specific rotation is symbolized by "[a]" and indicated in "°."

Concentration

The Concentration is the density of a liquid solution made by dissolving an optically active substance in water or alcohol. It is indicated in "a/100ml."

• Purity The Purity is the proportion of sucrose compared to the soluble solid content in a sample. It is indicated in "%." To measure the purity, input the Brix value of the sample (which can be obtained by using an ATAGO refractometer) into the AP-300 before taking a measure
